

Service terminal

Service terminal

Service terminal

Diagnostic unit for various **OSF** control units.

Diagnosis unit with plain text display for customer service and assembly. The **OSF** service terminal is the only service unit which can be used for maintenance work to swimming pool control units, such as filter controllers, solar controllers, pneumatic controllers, backwashing controllers etc.

It is protected by patent and can only be supplied to **OSF** representatives or our authorised foreign representatives or support centre distributors.

A wide range of control unit devices produced by **OSF** are fitted with a diagnosis plug on the circuit board. The service terminal can be connected to this plug.

The diagnosis unit can be used to ensure that both efficient and time-saving maintenance work can be carried out. The service terminal function is dependent on the controller to which it is connected. It can, for example, be used to read out operating hour counters for pumps, heating, solar heating, event counters for backwashing or error message counters. In addition, it can be used to scan operating conditions, call up temperature sensor values, to program parameters and lots more.

The service terminal is CE tested and complies with current EU regulations.

Item No.: 3010000900

Subject to alterations! 04/04
